### Description

Active Phone Server (APServer) is an application designed to manage your incoming and outgoing phone calls. All essential features are supported: advanced answering machine, caller ID function which displays a caller's information when a call is received, and enables you to customize voices and melodies for each phone number. Active Phone Server also includes an ISP dialer which allows you to dial your ISP number(s), notifying you with a sound when a connection is established (or a connection is severed), and an e-mail checker which notifies you of any new messages, and displays the subject and several lines from each message. In addition, it includes a reminder function to notify you of all events you do not want to miss, as well as a phone book, a clock, and a logging utility. The program runs as a convenient icon in the System Tray area of the Windows taskbar.
